0

Below is an exerpt of the ladder logic to control the pick and place device shown in the simulation. Logic related to other parts of the machine have been removed. The 'main' part of this code is from line 1 to line 532 (ED). Below line 532 (ED) are 11 subroutines.

The pick and place device consist of 3 servor motors, 2 pnuematic solenoids and 1 laser sensor (analog input).

The PLC used in this project is a Panasonic FP-XH C60TD with an analog input cassette (AFPX-AD2). The antique software used to write the ladder logic is called FPWIN GR, which will be discontinued on September 30, 2024.

The first line Y19 is the contactor that controls the main power for the pick and place device. R1 never turns off.

R1 ─┤/├─ Y19 [ ] TB1

2

Pneumatic solenoids: Y14 and Y10
Y10 controls the end effector
Y14 ejects misplaced belt loops from the device

R97 ─┤ ├─ Y14 [ ] AirJetOut

4

R155 ─┤ ├─ Y10 [ ] sol1picker
hmi pinch
R11B ─┤ ├─
autoPick

7

Emergency stop: XE
When the emergency stop is pressed -
-all the servos are disabled (Y1C, Y1B, Y16)
-the main air is shut off (Y18)
-the device must be rehomed (R98)
-the pick and place cycle is reset and turned off (R10A, R10B, R10C, R99)
{in FPWIN GR: DF = leading edge of a signal and DF/ = trailing edge of a signal}

32 Pick and place cycle shown in the simulation.

The pick and place cycle consist of 8 states. The cycle starts at state 1 and increments +1 to state 8 where the cycle ends and starts again at state 1.
[state 1 -> state 2 -> ... -> state 8 -> state 1 -> state 2 -> ...]

Each state is described using 3 relays (R10A, R10B, R10C).
For example:
R10A = off, R10B = off, R10C = off
State 000: State 1
or
R10A = off, R10B = off, R10C = on
State 001: State 2
If all relays are on (on, on, on = State 111 = State 8)

The states follow this order: 000, 001, 010, 011, 100, 101, 110, 111
A brief description of each state:
000: Measure with laser the height of fabric, index magazine if it is empty
001: Index X servo right
010: Index Y servo down
011: Turn end effector on
100: Index Y servo up
101: Index X servo left
110: Turn end effector off
111: Restart cycle

From the HMI the cycle is started, there are 2 options on the HMI:
automatic mode (R99)
step mode (R127)[when R127 is on, another button is available on the HMI to step through each state manually (R126)]

R98 (HOMED) — R9F (hmiON) — (DF) — R99 (autoCycle) <SET>

38 C1022 (conEmptyCount) — (DF) — R99 (autoCycle) <RST>
R128 (hmiOFF) — (DF/)

47 R98 (HOMED) — R126 (stepTrigHmi) — (DF) — R129 (stepTrig) [ ]

51 State 1: 000: Measure with laser the height of fabric, index magazine if empty
R94 sets off a series of events that measures the stack of fabric.
-If the laser measurement is empty, the magazine is indexed 1 position, and R94 is triggered again. This continues until a non empty measurement is taken or until every magazine cartridge has been checked. If all cartridges measure empty, the cycle shuts off and must be restarted by the operator.
-If the laser measurement is not empty, bit 2(R10C) is set and the program moves to State 2.

R99 (autoCycle) — R10A (bit 0) — R10B (bit 1) — R10C (bit 2) — XB (ch1 safe) — R10F (wait) — (DF) — R94 (measureTrig) [ ]

```

131 R11A (wait) R911D (ch1 sig) (DF/) → R11A <RST> (wait); R10C <SET> (bit 2)

141 State 4: 011: Turn end effector on
The end effector(R11B) contains 30 needles. When actuated, the needles eject out of the end effector, stabbing the fabric. The amount the needles eject out of the end effector is adjustable. If the needles stick out too far, multiple belt loops are picked up. If the needles stick out not enough, the belt loop will not be picked up/sometimes be picked up. This adjustment must be done physically at the machine. An improvement to this machine would be to have the end effector adjustable electronically - this does not exist - that I'm aware of. When the 0.2s timer (TMR 3) goes off, the program moves to State 5.

XE (ESTOP) R127 (stepScreen) R10A (bit 0) R10B (bit 1) R10C (bit 2) (DF) → R11B <SET> (autoPick); R11C <SET> (pickTimer)
